EPIDEMIC OF CHRONIC ILLNESS

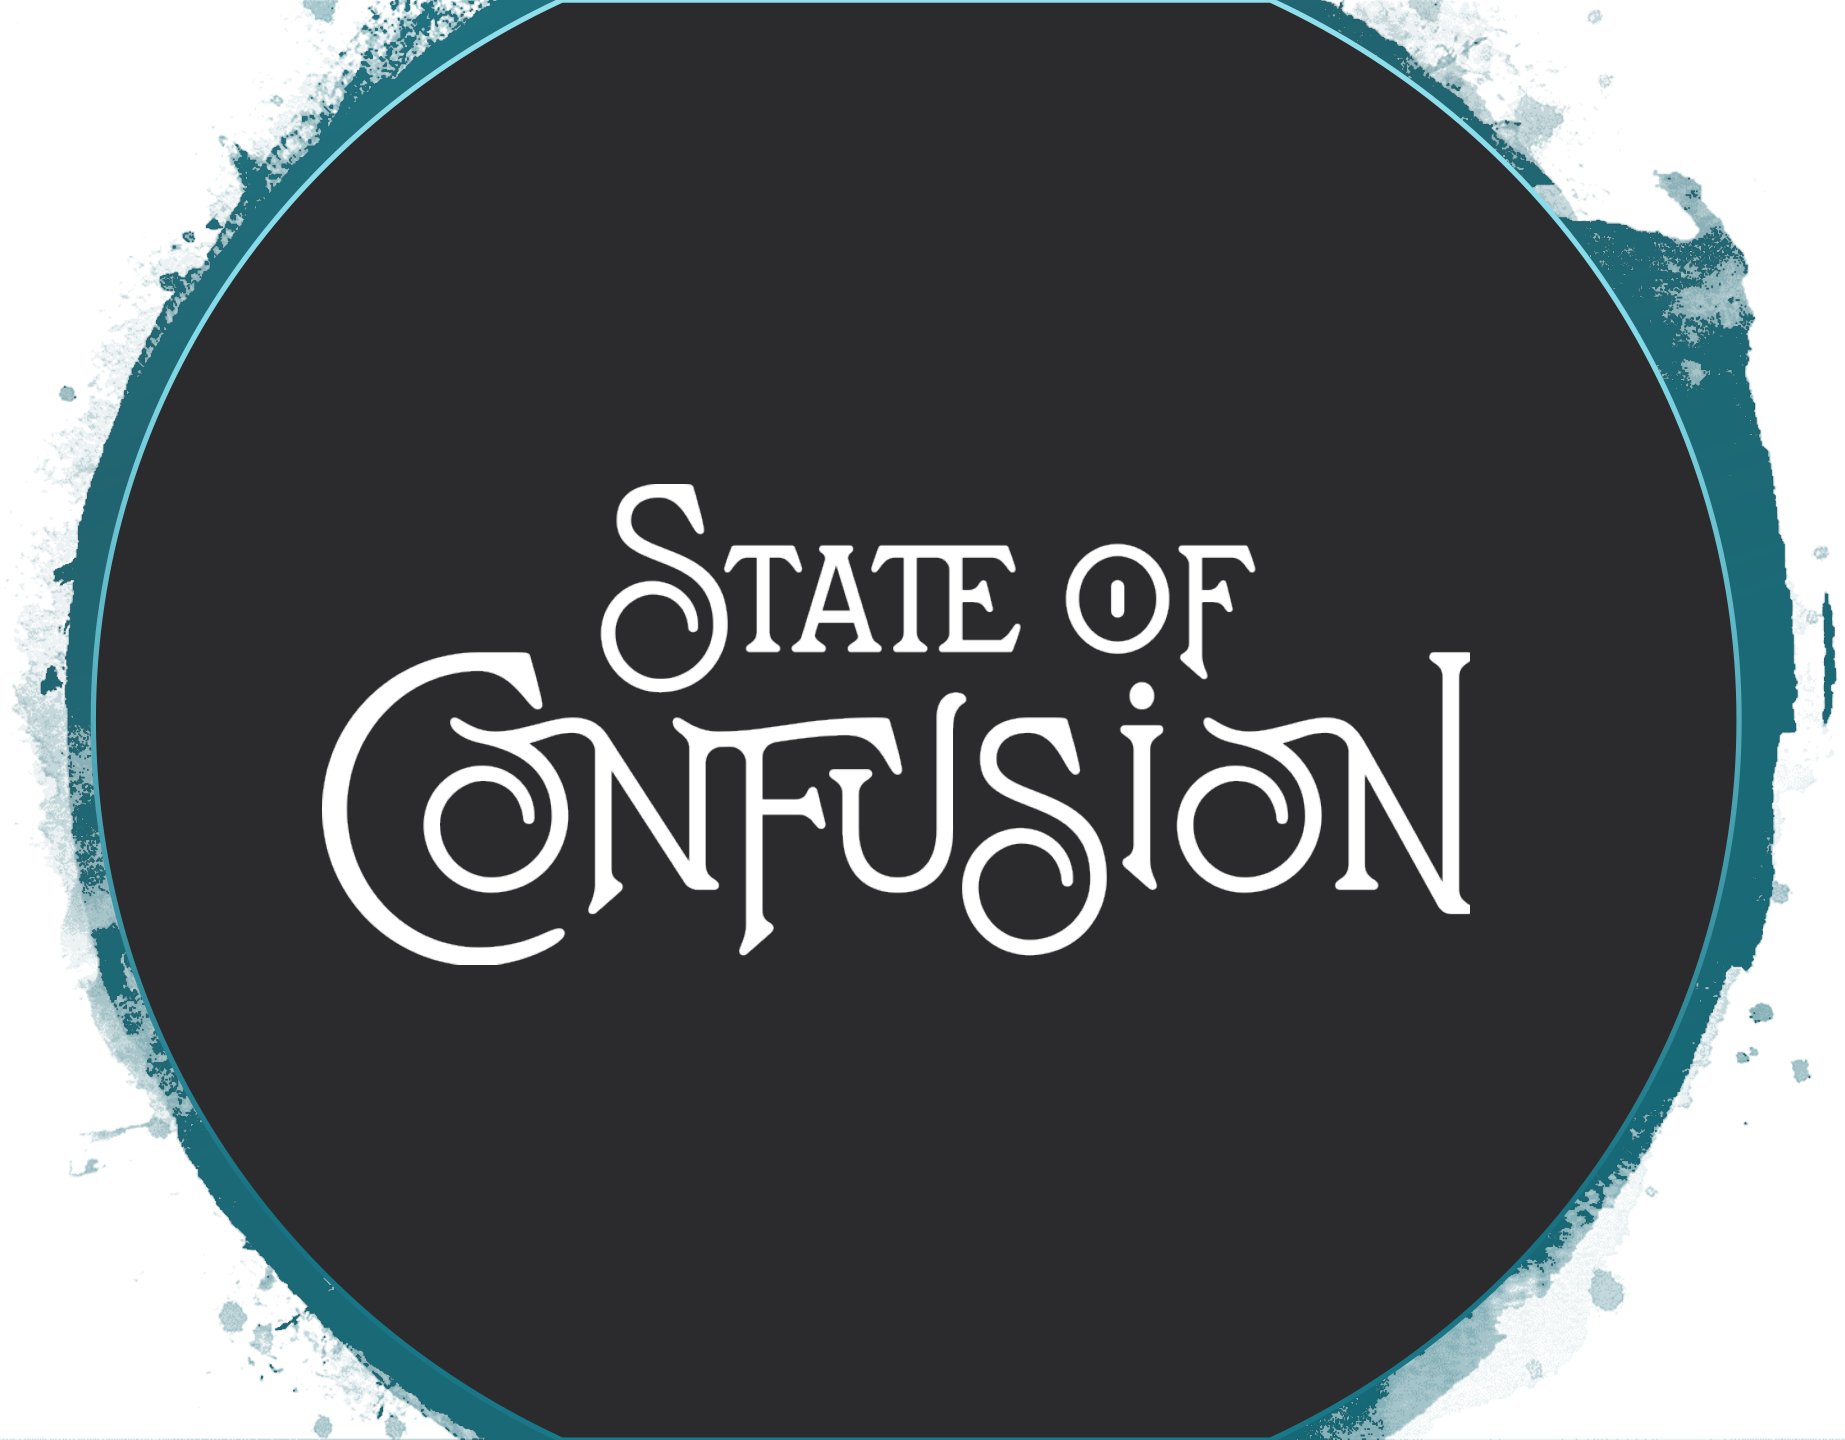

in·vis·i·ble

mis·un·der·stand·ing (noun):

failure to understand something correctly

STATE OF CONFUSION

"PAIN" : Symptom? Disorder? Both?

Hmmnn ...??

... same term used to describe a symptom, secondary condition and a disease state?

"I have
chronic pain"

VS.

"I have
RA"

"I have
IBS"

"I have
migraine"

Central component of pain - but also other system-specific symptoms

Comorbidities & Biopsychosocial Experience: *Not all "Chronic Pain" Looks the Same*

Diabetic Neuropathy
+ Diabetes
+ Obesity
+ Sleep Disorder

FM, IC, Migraine, TMD
+ Cognitive Impairment
+ Sleep Disorder
+ Chronic Fatigue
+ Mood Disorder
+ Sexual Dysfunction

stig·ma·ti·za·tion

*action of regarding someone as worthy
of disgrace or great disapproval*

bi·as

*cause to feel or show inclination or
prejudice for or against someone*

NO PAIN
NO GAIN

**PAIN IS
WEAKNESS
LEAVING THE BODY.**

THE PAIN
you feel today will be
THE STRENGTH
you feel tomorrow.

It's now become somewhat acceptable to have pain ...

but not to be **WEAK** enough ...

to allow yourself to be impacted by it ...

HELLO

I AM

what you
label me

Insufficient
workforce

No team-based
medical home

Myriad of
heterogenous pain
disorders/subtypes

Symptom-based
classification

Lack of scientific
understanding

Lack of objective
measures, markers,
diagnostics

cha·os

*a state of utter confusion
a total lack of organization or order*

cri·sis

*an unstable or crucial time in which
a decisive change is impending*

cri·sis

*a dramatic emotional or circumstantial
upheaval in a person's life*

100 million

\$600 billion

#1 Cause Disability

Deaths

Susan:

**"To live in pain is to
live in isolation."**

Explosion of Therapies

But ... what works for whom? At what risk? At what cost?

"Unfortunately, the field of chronic pain treatment is strikingly deficient in high-quality scientific evidence."

Former FDA Commissioner Dr. Robert Califf
NEJM 2016;374:1480-5

Current Treatment of Chronic Pain: "Blindfolded Darts"

May be Good for Team-Building ... but not so much for Personalized Medicine

"Without data, we are just docs with opinions."

What does pain
research mean to
patients?

"Some people
cannot be cured,
but everyone can
HEAL."
~Unknown

Patient Hopes for Pain Research

1. Objective measures, markers, predictors

2. Dynamic outcome measures that account for chronic pain complexity

- How to define “improvement?”
- Does VAS measure what we think? Does it really matter?
- Develop well-rounded measures that incorporate function, QOL, sleep, mood, etc.

3. Animal/human models that account for chronic pain complexity

- Multi-system illness - neurological, endocrine & immune systems
- Bidirectional impact of fatigue, mood, sleep, etc. on pain
- Bidirectional impact of other chronic diseases on pain

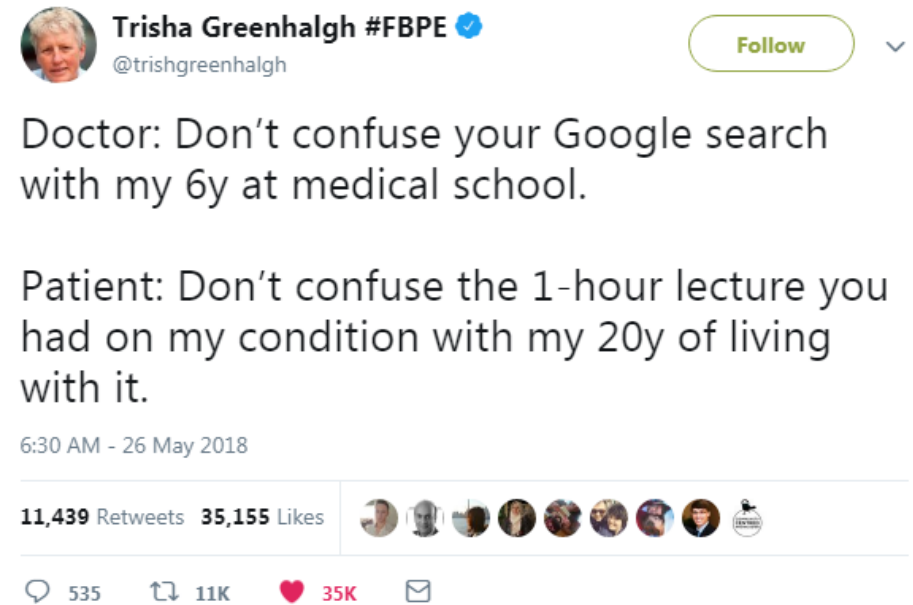

4. Trials that account for complexity & individuality of pain experience

- What is going to work for me – PMI?
- Impact of pain & non-pain comorbid conditions
- Effect of treatment combinations (Rx & NonRx)
- Function, QOL & individualized goal setting

5. Reverse Translation & Broad Inclusion

- Listen to and learn from patients
- Include patients (and other stakeholders) early and often

Mutual Value & Respect

Knowledge Translation

Include All Stakeholders & Implementation Science Plans Early and Often

Bridge the Translational Divide

Ensure Successful Implementation

Reduce the Knowledge Translation Gap

Thank you!
